

# Problem set 4

Alexandra Penner

January 2018

## 1

I would be interested in scraping political data, such as election results from states.

## 2

its a list. fromJSON outputs a list that has to be converted to a dataframe by the user by wrapping the call in as.data.frame()

## 3

df is of class SparkR, and df1 is of class data.frame

## 4

it is an error because spark's select does not apply to data frames

## 5

filter fails as well.
